ABSTRACT

This project presents the design and development of a **database-driven Healthcare Management Web Application** aimed at improving the efficiency and accuracy of handling healthcare-related information in a digital environment. The system provides a structured platform to **store, retrieve, and manage** core clinical and administrative data such as **patient profiles, doctor and department details, appointments, medical records, prescriptions, laboratory tests and results, and billing/payment transactions**. A Python-based backend is used to implement the business logic and ensure reliable processing of requests, while the frontend built with **HTML and CSS** offers a simple and user-friendly interface for data entry, search, and record viewing.

The application is modeled using an **Entity Relationship (ER) design** to maintain data integrity through well-defined relationships (primary and foreign keys) and to reduce redundancy via normalization. By centralizing records and supporting basic reporting and tracking, the project helps minimize manual paperwork, improves accessibility of patient information, and enables better coordination between clinical, laboratory, and billing modules. Overall, the system demonstrates how a relational database and web technologies can be integrated to create a secure and organized healthcare record management solution suitable for small clinics or as an academic prototype.

OBJECTIVES

To design an application UI and a normalized database for disease prediction and appointment management system and to perform operations after establishing necessary connectivity between them. Also generate schema diagram and ER diagram for the designed database.

OBJECTIVES:

- To develop a database-driven web application that digitally manages healthcare information in a structured and organized manner.
- To store and maintain patient records securely including personal details, visit history, and medical records with proper database relationships (PK/FK).
- To manage doctor and department information to support correct assignment and tracking of consultations.
- To implement appointment scheduling and tracking so patients and doctors can manage visits efficiently (scheduled/completed/cancelled).
- To record diagnoses and prescriptions and link them to the corresponding patient and doctor for accurate clinical history.
- To support laboratory test ordering and result storage to maintain complete patient reports within the system.
- To generate billing invoices and record payments for basic financial tracking and transparency.
- To provide a user-friendly interface (HTML/CSS) for easy data entry, searching, and viewing of healthcare records.
- To ensure data integrity and reduce redundancy through proper ER modeling, normalization, and validation in the backend.

ENTITY-RELATIONSHIP DIAGRAM

ER DIAGRAM FOR THE APPLICATION:

DATABASE SCHEMA

SOFTWARE SPECIFICATION

FRONT END TECHNOLOGIES:

- HTML and CSS - for building and styling the user interface/pages.

BACK END:

- Python - for server-side logic such as handling requests, validations, and database operations.
- Database – MySQL - to store and manage patient, appointment, medical, and billing records.
 - High performance & reliability: MySQL is optimized for fast read/write operations and supports transactions (InnoDB), making it stable and efficient for handling structured records like patients, appointments, and billing.
 - Easy integration & wide support: It integrates smoothly with Python frameworks/libraries (e.g., Flask/Django with MySQL connectors/ORMs) and has broad community, hosting, and tooling support (phpMyAdmin, MySQL Workbench), which is often simpler compared to many alternatives.

DB CONNECTIVITY STEPS/ CODE & SQL QUERIES

1) MySQL DB Connectivity Steps.

- i) Install MySQL Server + MySQL Workbench
- ii) Create Database
- iii) Create Tables
- iv) Install Python MySQL library
- v) Configure DB credentials in Python
- vi) Test connection
- vii) Perform CRUD operations

2) Python Connectivity Code

```
from flask import Flask, request, jsonify
import mysql.connector
```

```
app = Flask(__name__)
```

```
def get_connection():
    return mysql.connector.connect(
        host="localhost",
        user="root",
        password="YOUR_PASSWORD",
        database="healthcare_db"
    )
```

```
@app.route("/patients", methods=["POST"])
```

```
def add_patient():
```

```
    data = request.json
    conn = get_connection()
    cursor = conn.cursor()
```

```
    sql = """
        INSERT INTO patient (first_name, last_name, dob, gender, phone, email, address)
        VALUES (%s, %s, %s, %s, %s, %s, %s)
    """
```

```
    values = (
        data["first_name"], data["last_name"], data["dob"], data["gender"],
        data["phone"], data["email"], data["address"]
    )
```

```
    cursor.execute(sql, values)
```

```
conn.commit()

new_id = cursor.lastrowid
cursor.close()
conn.close()

return jsonify({"message": "Patient added", "patient_id": new_id}), 201

@app.route("/patients/<int:patient_id>", methods=["GET"])
def get_patient(patient_id):
    conn = get_connection()
    cursor = conn.cursor(dictionary=True)

    cursor.execute("SELECT * FROM patient WHERE patient_id=%s", (patient_id,))
    row = cursor.fetchone()

    cursor.close()
    conn.close()

    if not row:
        return jsonify({"message": "Patient not found"}), 404

    return jsonify(row), 200

if __name__ == "__main__":
    app.run(debug=True)
```

3) INSERTION

```
INSERT INTO patient (first_name, last_name, dob, gender, phone, email, address)
VALUES ('Amit', 'Sharma', '2002-04-12', 'Male', '9876543210', 'amit@gmail.com', 'Pune');

INSERT INTO doctor (first_name, last_name, specialization, phone, email)
VALUES ('Neha', 'Patel', 'Cardiology', '9123456780', 'neha@clinic.com');

INSERT INTO appointment (patient_id, doctor_id, appointment_date, appointment_time,
reason)
VALUES (1, 1, '2026-04-01', '10:30:00', 'Routine checkup');
```

4) SELECT

```
SELECT * FROM patient;
```

```
SELECT * FROM appointment WHERE appointment_date = '2026-04-01';
```

```
SELECT
  a.appointment_id, a.appointment_date, a.appointment_time, a.status,
  p.first_name AS patient_first, p.last_name AS patient_last,
  d.first_name AS doctor_first, d.last_name AS doctor_last
FROM appointment a
JOIN patient p ON a.patient_id = p.patient_id
JOIN doctor d ON a.doctor_id = d.doctor_id;
```

5) DELETION

```
DELETE FROM appointment WHERE appointment_id = 1;
DELETE FROM patient WHERE patient_id = 1;
```

6) View

```
USE healthcare_db;
```

```
CREATE OR REPLACE VIEW vw_patient_appointment_summary AS
SELECT
  p.patient_id,
  CONCAT(p.first_name, ' ', p.last_name) AS patient_name,
  COUNT(a.appointment_id) AS total_appointments
FROM patient p
LEFT JOIN appointment a ON a.patient_id = p.patient_id
GROUP BY p.patient_id, p.first_name, p.last_name;
```

7) TRIGGER

```
DELIMITER $$
CREATE TRIGGER trg_patient_phone_update
AFTER UPDATE ON patient
FOR EACH ROW
BEGIN
  IF OLD.phone <> NEW.phone THEN
    INSERT INTO patient_audit (patient_id, action_type, old_phone, new_phone)
    VALUES (OLD.patient_id, 'UPDATE', OLD.phone, NEW.phone);
  END IF;
END $$
```

```
DELIMITER ;
```

APPLICATION USER INTERFACE

- **LOGIN PAGE (USER)**

- **HOME PAGE**

- **SYMPTOM CHECKING PAGE**

- **APPOINTMENT BOOKING PAGE**

The screenshot shows the 'Find Specialists' section of the Medical Risk Assessment dashboard. The user's diagnosis is 'Paralysis (brain hemorrhage)'. The search filters are set to City: Mumbai and State: Maharashtra. A 'Search Doctors' button is present. Below the search bar, a green notification bar states 'Found 2 specialist(s) in Mumbai'. The first specialist listed is Dr. Sachin Naidu, a Neurologist with a 4.61 rating (93 reviews). His profile includes his hospital (Continental Hospital, Mumbai), location (Maharashtra), phone number (+91-9191010756), and 22 years of experience. A 'Book Appointment' button is visible at the bottom of the specialist's profile.

- **BOOKING DETAIL PAGE**

The screenshot displays the 'My Appointments' section. A 'New Assessment' button is at the top right. The appointment details for 'APPOINTMENT #12' are shown, with a status of 'Pending'. The appointment is scheduled for March 31, 2026, at 11:00 AM. The doctor is Dr. Sachin Naidu, a Neurologist at Continental Hospital, Mumbai. The condition is 'Paralysis (brain hemorrhage)' and the symptoms are 'Nausea', 'Fatigue', and 'Yellow Eyes'. There are 'Reschedule' and 'Cancel' buttons. The appointment was booked on Mar 27, 2026.

- **MEDICAL ASSISTANT PAGE**

The screenshot shows the 'AI Medical Assistant' chat interface. The assistant is online and provides general health information. A disclaimer states: 'This AI assistant provides general health information. Always consult a healthcare professional for medical advice.' The assistant's message reads: 'Hello! I'm your AI Medical Assistant. I can help you understand diseases, symptoms, and health conditions. You can ask me questions like: • "What is a brain hemorrhage?" • "What are common symptoms of stroke?" • "When should I see a doctor for headaches?" • "How can I prevent paralysis?" How can I help you today?'. There is a text input field for the user to ask questions, with a 'Send' button. Below the input field, there are three suggested questions: 'What is a brain hemorrhage?', 'Symptoms of stroke?', and 'When to see a doctor?'.

CONCLUSION

The proposed database-driven Healthcare Management Web Application successfully demonstrates how clinical and administrative activities can be digitized using a structured MySQL database with a Python backend and a web-based interface. The system centralizes important information such as patient details, doctor data, appointments, and related records, making storage and retrieval faster and more organized compared to manual paperwork. The overall design focuses on practical usability, and the UI was intentionally kept simple and easy to navigate so that elderly users can use it comfortably without confusion.

One of the main advantages of this project is efficient and reliable data management—MySQL ensures data integrity through relationships (primary/foreign keys) and supports quick searching and updating of records. In addition, the system reduces redundancy, improves accuracy, and saves time for staff by automating common tasks like record lookup and appointment tracking. With a clean interface and database-backed structure, the project offers a scalable foundation that can be extended in future with modules such as advanced reporting, role-based login, and enhanced security features.
